

## Overview

Imagine an insurance branch with hundreds of policies to be managed and printed. Imagine a bank office with the quantity of documents, processes and folders needed to create a loan process. Keeping the holders' personal data together and collecting them in the shortest time as possible, yet ensuring the confidentiality, is a challenge for the operators.

ScanBox helps you collect documents and direct them to a specific local or Cloud destination, with a single click on the multifunction printer panel, and send them to the business application in use. Fast, accurate, safe.

## What is ScanBox

ScanBox is a Cloud workflow solution that enhances the scanning capabilities of multifunction devices, powering them with the interaction with business applications. ScanBox helps control and simplify scanning tasks by integrating the document flow through interactive menus and customized buttons on the printer control panel. The workflow is fully integrated with your business application: custom plugins adapt

to user needs, thus providing an optimal scanning experience. With the ScanBox web interface it is easy to create the settings for the workflows, manage them through a secure web portal and apply them to all the devices involved in the process, without intervening on the IT infrastructure.

## How it works

At a touch of a customized button on the printer panel, which corresponds to a specific function or the type of document that must be imported into the business application, the scanned documents are sent, protected by an SSL protocol, to the server or to the Cloud (private or public), where they are processed by ScanBox, applying predefined rules. The documents are then sent to the business application, or redirected to the preset destination.

Managing ScanBox and creating new scanning options is simple and immediate, thanks to the web platform accessible anywhere, anytime, and with no impact on the Customer's IT infrastructure, while ensuring network and document protection.

## Features

### Basic Flow

scan-to-any destination, with ScanBox workflow features (Barcode, OCR, plugins).

### Dynamic Flow

application-driven scanning and workflow: create a one-time scan button on the MFP from the application to collect all documents in one job and process them with ScanBox plugins

### Virtual Printer

send documents to a ScanBox workflow by printing them from any Windows PC, over the Cloud

### Smart Folder

documents on a Windows PC join the ScanBox workflow and its features, without requiring any VPN

## Benefits

### Remote scanning management

the workflow settings can be configured remotely via the web portal, accessible anytime anywhere with personal credentials.

### Respect of the infrastructure

ScanBox doesn't burden the network and doesn't require admin accesses to your server. There's no need for specific configurations on the network, as everything is managed via the web portal.

### Cloud ready

ScanBox can be used as a Cloud service, but it can also be installed on-premise, to ensure flexibility in hybrid environments.

### Security

your documents are protected by state-of-the-art security protocols over the transmission and the whole process.

### Customization

ScanBox can personalize your workflows thanks to powerful plugins that enrich your processes by adding indicization, data extraction, routing to multiple destinations, and much more.

### Documents consistency

ScanBox can streamline the formatting of documents coming from different sources, in order to meet Company standards.

### OCR and barcode

the robust OCR engine can transform your documents into PDF/A, PDF searchable and Office formats, extracting the requested data and processing information contained into barcodes.

### Available

for HP, Lexmark, Xerox, Canon, Ricoh, Kyocera and Olivetti (Konica Minolta) devices .
